

BWR Website — Handover Checklist

Everything the new owner needs to do, in order, to take over the site
BWR = Biking, Walking, Running — the maps that make your life easier

Welcome! This website is not one single file — it is made of a few parts that all work together. Follow the steps below **in order** and tick each box as you finish. By the end, the website will be fully yours and running on your own accounts.

What you are receiving

Part	What it is
The code	All the files the website is built from (kept on GitHub).
Cloudflare	The online service that runs the website.
The saved data (KV)	All users, map paths and reports the site has stored.
The domain	The web address people type to visit the site.
Service accounts	Outside helpers for emails and maps (you make your own).

Do these steps in order

Step 1: Get the code (GitHub)

Make a free account at github.com if you don't have one.

Ask the seller to **transfer the project (repository)** to your GitHub account, or to send you a download (a ZIP file).

This is the box of building blocks the whole website is made of.

Step 2: Make your Cloudflare account

Go to cloudflare.com and create a free account.

This is the service that actually runs the website online (it's called a "Worker").

Tip: use an email and password you control and will keep.

Step 3: Install the tools on your computer

Install **Node.js** from nodejs.org (this lets you run the website's commands).

Open the project folder, then in a terminal type: `npm install`

This downloads the extra pieces the project needs.

Step 4: Create your storage (KV)

In the terminal, run: `npm run kv:create BWR_KV`

This creates the "memory" where users and map paths are saved.

Copy the ID it gives you into the file `wrangler.jsonc` (the seller can show you where).

Step 5: Get your own secret keys

Maps: sign up at openrouteservice.org and copy your key (called ORS_KEY).

Emails: sign up at resend.com and copy your key (called RESEND_API_KEY).

Emails (sender address): in Resend, verify your domain, then set the sender as RESEND_FROM, for example BWR <noreply@yoursite.com>. The address **MUST** use a domain you have verified in Resend, or emails will silently fail to send.

Add them with: `npx wrangler secret put ORS_KEY` (then the same for RESEND_API_KEY and RESEND_FROM).

Use YOUR OWN keys — never the seller's — so any costs go to you, not them.

Step 6: Put the website online

In the terminal, run: `npm run deploy:worker`

Cloudflare will give you a web address ending in `.workers.dev`.

Open that address in your browser — your copy of the site is now live!

Step 7: Move the saved data over

If you want the existing users, paths and reports, ask the seller to **export the data** from their storage and give it to you.

Import it into your own storage (the seller or a developer can run a short script for this).

Skip this only if you want to start completely fresh and empty.

Step 8: Become the admin

If you started fresh: open `/api/setup` once to create your admin account.

If you took over the seller's data: ask the seller for the existing admin login.

The admin can draw paths, manage reports and change user plans.

Step 9: Connect your web address (domain)

If a custom address (like `yoursite.com`) is included, have the seller **transfer the domain** to you.

Point it at your Cloudflare Worker (Cloudflare has a guide for this).

Update `API_URL` in `js/config.js` to match your address.

Step 10: Final check — test everything

Open the site and try to: register a new account, log in, and plan a route.

Report a fake problem and check it appears for the admin.

Send a test email (registration) and confirm it arrives.

No email? It's almost always RESEND_FROM (Step 5): the sender address must use a domain you've verified in Resend, otherwise emails fail silently with no error.

If all of these work, the handover is complete. ✓

Important things to know

■ **Other people's private data.** This website stores real users' email addresses and passwords. Looking after other people's private information is a legal responsibility (especially in France/EU). Keep it safe, don't share it, and tell users if the owner changes.

■ **Never reuse the seller's secret keys.** Always create your own (Step 5). Otherwise the seller could still control parts of your site, or get billed for your usage.

✓ **Get it in writing.** Before money changes hands, write a simple agreement listing exactly what is included: the code, the domain, the data and the accounts. This protects both of you.

Need help with a step? The seller can run the data export/import and show you the exact files to edit. Take it one box at a time — you've got this!
